Transporting trucks and cars by sea saves around half the costs of road transport thanks to lower fuel costs and less wear and tear on vehicles. A single ship can carry up to 20,000 tons of cargo, which translates into the equivalent of 500,000 tons of road traffic. A comparison of ship and road transport shows that shipping is environmentally friendly, reduces the risk of accidents, and saves costs.

Omnitrax Lines help contribute to safeguarding the environment as the two are significantly more efficient than road transport. Compared to rail transport, ships can carry more cargo, which reduces CO2 emissions. Moreover, ships consume much less fuel than other transport modes. In comparison, ships are efficient and cost-effective, with the potential to transport even larger amounts of cargo. In addition, they are more sustainable than other transport modes and have a lower impact on the environment.

The frequency, speed, and punctuality of shipping services differ significantly from those of road transport. Ships can travel at speeds of up to 20 knots, while road transport is limited to 80 km/h. Ships can carry large quantities of cargo without restrictions, while road transport is subject to weight and size limits.

**CARGO SAFETY**

Drivers can stop the journey and reach their destination with a clear digital navigation system. The trucks are equipped with GPS devices, which ensure the safe and efficient transport of cargo. The drivers are trained and experienced, and they are provided with the necessary tools to handle hazardous materials.

**CARGO SAFETY**

During navigation, vehicles are monitored 24 hours a day with closed-circuit cameras. The terminals are managed directly by Omnitrax Lines, which ensures that the delivery process is seamless and secure. The company has implemented advanced systems to control incoming and outgoing vehicles and surveillance.
